

NH-100 Air

SMALL AIRPLANE ENGINE OIL PRE-HEATER WIRELESS REMOTE CONTROLLER

Small airplane pilots, especially in northern climates, hate the waste of time required to arrive at their airfield an hour or more before take-off, just to turn on their engine pre-heater and then to wait around while it warms their engine oil before enjoying their flight.

The Nighthawk NH-100 Air, as sold with paging service by local providers, avoids this waste of time by enabling the pilot to call from any (cell or home) phone to trigger a paging signal which will remotely turn on (or off) their engine pre-heater long before they leave for, or arrive at their airfield.

Nighthawk's NH-100 Air is normally off, but can switch on electrical devices for up to 15 amps of 120 volt household or commercial wall socket electrical power, as instructed by your paging commands, for various periods of time or indefinitely.

FEATURES

- Wirelessly controlled remotely via call-in paging – no phone line required at airfield.
- Both plugs into and switches a single common 15 amp 120 volt grounded outlet.
- Embedded paging antenna built-in, or use connector for optional external antenna.
- Many Nighthawk units can share a common paging account and paging phone number.
- You can use your paging service or we can bundle a paging service with the product.

ABOUT THE COMPANY

For almost two decades, Nighthawk has been designing and manufacturing easy to use "Plug and Play" wireless switches to remotely control virtually any electrical device, from any location. Our products set the standard for excellence in those areas that matter most to our customers, including technology, ease of use and installation.
